1.8.4 Using Relay Output

The ND-6060 contains two types of relay : Form C and Form A. The relay R3 and R4 are form C relays, and R1 and R2 are plain form A type. The difference between these two types of relay are:

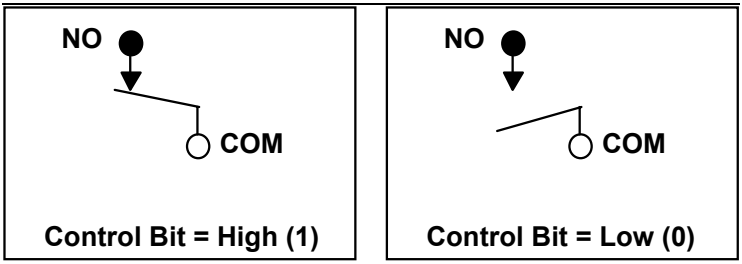

1. Form C Relay : (R3, R4)

Form C relay has three contacts : NC (Normal Close), NO (Normal Open), and COM(Common). The CM post, located at the middle, can make contact either NO post or NC post. When the control bit is high (1), the COM post and NO post are contacted. If the control bit is low (0), the COM post and NC post make contact.

In normal power-up and reset, the relay is in ***low*** status.

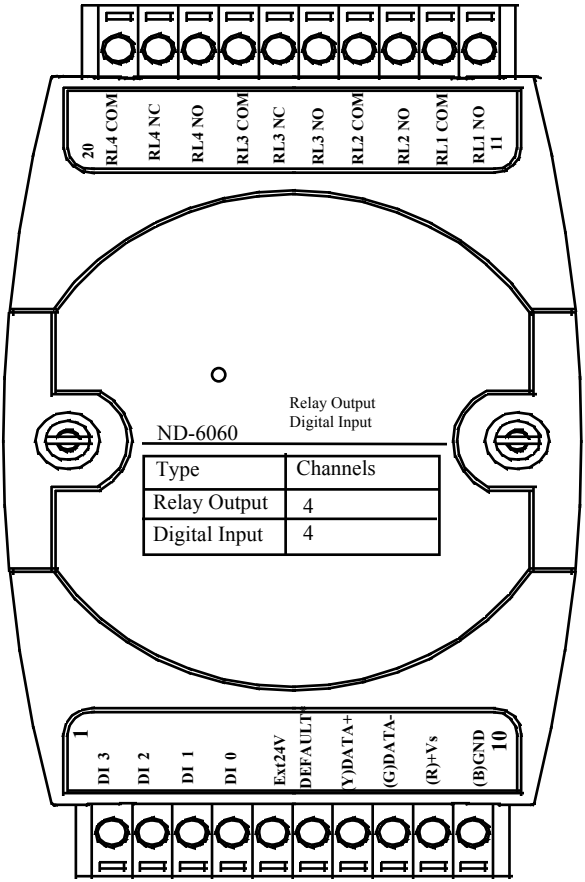

2. Form A Relay : (R1, R2)

Form A relay only has two contacts : NO (Normal Open) and COM(Common). The COM post can make contact either NO post or not contact NO post. When the control bit is high (1), the COM post and NO post are contacted. If the control bit is low (0), the COM post and NO post does not make contact. In normal power-up and reset, the relay is in ***low*** status.

2.2 Initializing a Brand-New Module

2.2.1 Objective of Initializing a Brand-New NuDAM

All NuDAM modules. except NuDAM-6520 and NuDAM-6510, in a RS-485 network must have an *unique* address ID, however, every brand-new NuDAM has a factory default setting as following :

- Address ID is 01.
- Baud rate is 9600 bps
- Check-sum disable
- Host Watchdog timer is disable

Therefore, to configure the brand-new NuDAM before using is necessary, otherwise the address ID will be conflict with others modules because the ID of new modules are identity . The baud rate may also be changed according to user‘s requirements.

The following sections show how to initialize a brand-new module, which is applicable for initializing NuDAM-6050, NuDAM-6052, NuDAM-6053, NuDAM-6054, NuDAM-6056, NuDAM-6058, NuDAM-6060, and NuDAM-6063.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

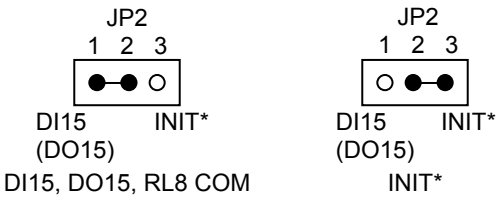

2.2.2 Default State

The NuDAM I/O modules must be set at *Default State* when you want to change the default settings, such as the ID address, baud rate, check-sum status etc. All NuDAM I/O modules have an special pin labeled as **DEFAULT***. The module will be in *Default State* if the **DEFAULT*** pin is shorted to ground when power ON. Under this state, the default configuration is set as following :

- Address ID is 00
- Baud rate is 9600 bps
- Check-sum disable

Therefore, the communication between host and the module will can be easily set as the same configuration, the initialization of a module will be possible no matter what configuration is set under operating state.

For ND-6053, ND-6054 and ND-6056, the pin 6 is used for both DI15(DO15) and DEFAULT*, and also the ND-6063, the pin 6 is used for both RL8 COM and DEFAULT*. The jumper setting is as below, and the default setting is DI15(D015) or RL8 COM. When you want to use ND-6053, ND-6054, ND-6056 or ND-6063 as Default*, you should open the module case to set the JP2.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

2.2.3 Initialization Equipments

- Host computer with an RS-232 port
- An installed RS-485 module (NuDAM-6520) with 9600 baud rate
- The brand new NuDAM module
- Power supply (+10 to +30 V_{DC}) for NuDAM modules
- Administration utility software

Note1: Never Connect the DRFAULT* pin to Vs or power source just left it open or wired to GND.

2.2.4 Initialization Procedure

1. Power off the host computer and the installed NuDAM-6520. Be sure of the baud rate of the NuDAM-6520 is 9600 bps.

2. Connect a brand new NuDAM module with the RS-485. Set the module in *Default State* by shorting the **DEFAULT*** pin. Refer to Figure 2.1 for detailed wiring.

3. Power on the host computer.

4. Power on the power supply for NuDAM modules.

5. Use the NuDAM Administrating utility to configure the address ID, Baud rate and check-sum status of the module.

2.3 Install a New NuDAM to a Existing Network

2.3.1 Equipments for Install a New Module

- A existing NuDAM network
- New NuDAM modules.
- Power supply (+10 to +30 V_{DC})

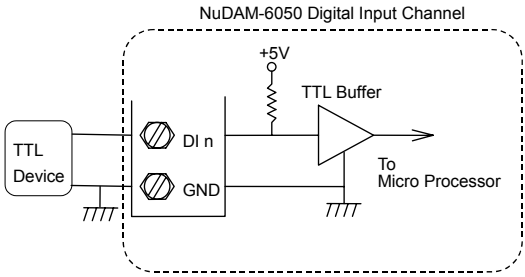

2.3.2 Installing Procedures

1. Configure the new NuDAM module according to the initialization procedure in section 2.2.
2. The baud rate and check-sum status of the new module must be identity with the existing RS-485 network. The address ID must not be conflict with other NuDAM modules on the network.
3. Power off the NuDAM power supply of the existing RS-485 network.
4. Power off the host computer.
5. Wire the power lines for the new NuDAM with the existing network. Be careful about the signal polarity as wiring.
6. Wire the RS-485 data lines for the new NuDAM with the existing network. Be careful about the signal polarity as wiring.
7. Wire to the input or output devices. Refer to section 2.4 for illustrations.
8. Power on the host computer.
9. Power on the NuDAM local power supply.
10. Use the NuDAM administration utility to check entire network.

Command Set

3.1 Command and Response

3.1.1 Introduction

The NuDAM command is composed by numbers of characteristics, including the leading code, address ID, the variables, the optional check-sum byte, and a carriage return to indicate the end of a command. The host computer can only command only one NuDAM module except those syncronized commands with wildcard address "**". The NuDAM may or may not give response to the command. The host should check the response to handshake with the modules.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

3.1.2 Document Conventions

The following syntax conventions are used to describe the NuDAM commands in this manual.

(Leading Code)	Leading Code is the first characteristic of the NuDAM command. All NuDAM commands need a command leading code, such as %,$,#,@,...etc. 1- character
(Addr)	Module's address ID, the value is in the range of 00 - FF (Hexadecimal) if no specified in the following 2- character
(Command Variable)	Items indicate command codes or value of variables Variable length
[Data]	Some output command need data Variable length
[Checksum]	Checksum in brackets indicate optional parameter, only checksum is enable then this field is required 2- character
< >	Identifies a control code character, such as <CR> for carriage return, its value is 0x0D. **1- character**

3.1.3 Format of NuDAM Commands

(Leading Code)(Addr)(Command)[Data]**[Checksum]**<CR>

When checksum is enable then **[Checksum]** is needed, it is

2-character.

How to calculate checksum value ?

[Checksum] = ((LeadingCode)+(Addr)+(Command)+[Data]**) MOD 0x100**

Example 1: checksum is **disable**

```
User Command:  $012<CR>
     Response:  !01400600<CR>
```

```
    $   : LeadingCode
   01   : Address
    2   : Command  (Read Configuration)
 <CR>   : Carriage return 0x0D
```

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Example 2: checksum is **enable**

User Command: $012**B7**<CR>
Response: !01400600**AC**<CR>

$: LeadingCode
01 : Address
2 : Command (Read Configuration)
B7 : Checksum value
<CR> : Carriage return 0x0D

'$' = 0x24 '0' = 0x30 '1' = 0x31 '2' = 0x30

B7 = (0x24 + 0x30 + 0x31 + 0x32 **) MOD 0x100**

'!' = 0x24 '0' = 0x30 '1' = 0x31 '4' = 0x34
'6' = 0x36

AC = (0x24 + 0x30 + 0x31 + 0x34 + 0x30 + 0x30 + 0x36 + 0x30 + 0x30 **) MOD 0x100**

Note : 1.There is no spacing between characters.
2. At end of command need a <CR> carriage return 0x0D.
3. Checksum is optional parameter.

3.1.4 Response of NuDAM Commands

The response message depends on NuDAM command. The response is also composed with several characteristics, including leading code, variables, and carriage return for ending. There are two kinds of leading code for response message, "!" or ">" means valid command and "?" means invalid. By checking the response message, user can monitor the command is valid or invalid.

Note : Under the following conditions, there will have **no response** message.

1. The specified address ID is not exist.
2. Syntax error.
3. Communication error
4. Some special commands does not have response.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

3.2 Summary of Command Set

There are three categories of NuDAM commands. One is the general commands, including set configuration command, read configuration, reset, read module‘s name or firmware version, etc. Every NuDAM can response to the general commands.

The second category is the functional commands, which depends on functions of each module, not every module can execute all functions.

The third category is the special commands, including functions about the programmable watchdog timer, safe values, and the programmable leading code.
