Simplify the Design and Deployment of Edge Computing and Edge AI Applications

Executive Summary

Embedded graphics enable system developers to boost the performance of a wide range of workloads, including medical imaging, image analysis, compute acceleration, and AI. Graphics solutions typically use graphics processing units (GPUs) to increase application speed and accuracy, as well as decrease latency. Many embedded system developers are using embedded graphics solutions in real-world applications, such as medical, manufacturing, and traffic management (Figure 2), along with other embedded segments.

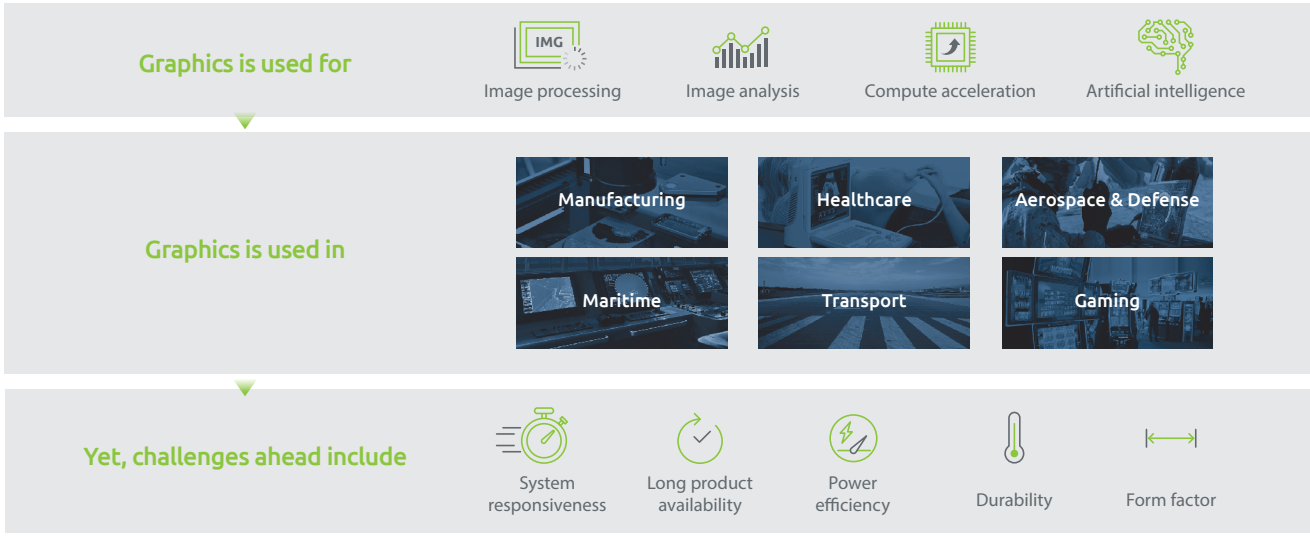

Figure 2. Graphics is widely used in embedded applications

Still, adding a GPU to an embedded system can be a complex task. One approach is to use graphics cards developed for the gaming application segment, which accounts for about a third of all GPUs[1]; however, these cards often do not satisfy key embedded system requirements, such as low system latency, long product availability, and power efficiency.

Addressing these issues, ADLINK products greatly simplify the process of adding GPUs to embedded designs. These products can satisfy a wide range of embedded requirements around performance, long lifecycle, power consumption, and form factor. The following section describes how ADLINK GPU solutions are being used in edge computing and edge AI applications, and the way ADLINK products can simplify the design process for system developers, OEMs, and systems integrators.

Key Design Objectives

The deployment of edge computing and edge AI applications satisfies many business objectives, including:

Improve Signal and Image Processing Performance

Embedded graphics solutions enable system developers, OEMs, and systems integrators to significantly improve signal and image processing performance in various application areas, including aerospace, maritime, medical, and industrial automation.

Optimize Investment, Maximize Productivity

Companies seeking to maximize the innovation and productivity gains from deep learning and AI should consider using a computing platform optimized for the associated algorithms.

Key Business Challenges

Solution providers implementing GPU-based solutions face various business considerations, such as:

Extending Product Lifecycle

Many commercial graphics solutions, such as those developed for gaming applications, have a relatively short lifecycle due to users' desires for the latest and greatest graphics technology. When embedded solution providers implement these commercial graphics solutions, they may be forced to conduct frequent product certifications, which can be time consuming and expensive. This situation is made more difficult by the relatively few vendors that offer embedded GPU-based computing solutions compared to general-purpose, CPU-based solutions.

Balancing Cost and Efficiency

Many AI workloads require large amounts of memory, parallel computing, and low-precision computation.[2] The challenge for system architects is to define an optimized AI platform that cost-effectively delivers these computing resources in ways that satisfy their speed and accuracy requirements. For platforms deployed at the edge, system architects must address additional requirements, such as environmental hardening and stringent SWaP constraints.

Solving Design Challenges

ADLINK products and services enable developers to improve their system designs, such as:

Increasing Embedded Graphics Performance

A common theme in the embedded application examples is the need to quickly move external data from sensors and other sources to the GPU for processing. ADLINK achieves this by implementing remote direct memory access (RDMA), a feature of NVIDIA GPUDirect™ technology in NVIDIA® Quadro® GPUs that can boost data throughput by approximately 80 percent (3.6 to 6.5 gigabytes per second). RDMA gives external data sources direct access to the GPU's external memory, as shown on the left side of Figure 3. Without this feature, data would be copied into a CPU's memory (red line on right side of Figure 3) before reaching the GPU, which needlessly increases data transmission delay and latency.

As an NVIDIA Quadro Embedded Partner with extensive experience in embedded applications, ADLINK is uniquely qualified to provide system developers with solutions using GPUDirect, enabling them to tap into the power of embedded graphics and AI.

Optimizing the Execution of AI Workloads

In order to attain an optimized computing platform for deep learning and AI solutions, developers may need to evaluate many areas (Figure 4), including:

- **Selecting Hardware:** Determine which computing cores and performance level are best suited to run the required AI algorithms and how much computing power and I/O bandwidth are needed. Hardware selection should also consider SWaP and cost constraints, particularly when deploying AI at the edge of the network.
- **Tuning AI Performance:** Identify bottlenecks in the software or hardware due to insufficient platform resources (e.g., memory, I/O, computing cores, and cache), inefficient scheduling of software threads, or contention between various running processes. This analysis typically requires software profilers and other types of performance tuning tools.
- **Deploying Dynamic Workloads across the Network:** Develop the ability to deploy and provision dynamic workloads across the network in order to improve inference results with refined AI models and tackle new challenges. Dynamic workloads require a flexible and adaptable computing architecture that enables a scalable, real-time, and reliable deployment environment.

Deep-Learning Consultancy and Optimization Services

Deep-Learning Consultancy Service

ADLINK offers consultancy services via deep learning profiling to help users determine the right hardware platform to cost-effectively fulfill their application needs, as shown in Figure 7. ADLINK developed a profiling tool that models computing platform performance based on the elements of AI algorithms, such as:

- Types of neural networks, like AlexNet, MobileNet, ResNet.
- Number of neural network layers.

The profiling tool runs these and other inputs against a large database of AI and deep learning accelerators and generates statistics, such as inferences per second; performance per watt; and performance per dollar, for popular neural networks. Additionally, the tool helps developers by determining which accelerator may offer the best performance for the neural networks used by their application.

Performance Profiling Service

For in-depth performance tuning, developers can have ADLINK run x86 and GPU performance analyzers on their software. These analyzers help identify hardware and software bottlenecks that, when remedied, can greatly increase throughput and inference per second, performance per dollar, and SWaP.

ADLINK is also working with research bodies and academic institutions to find bottlenecks on AI platforms to profile system issues that can be addressed for performance improvement. For example, it is possible to determine if the system is making too many memory copies or if increasing resources (e.g., memory size) will boost performance.

Dynamic Workload Deployment

ADLINK's Data River™ is an underlying technology for deploying dynamic workloads and enabling data to move freely. It solves a key challenge when developing AI solutions, which is allowing data exchange and workload provisioning across the entire network. The solution helps communicate data among computing nodes and devices.

ADLINK's solution can scale acceleration engines over a distributed data service (DDS), which is a type of message-oriented middleware supporting a data-centric publish and subscribe style of communication. This distributed architecture allows a massive number of computing nodes to be attached to the network. In other words, users can add additional hardware accelerators that best fit their application needs based on profiling results, even after AI is deployed.

Customization Services

Specification customization is often needed to deliver optimized solutions for different embedded market segments. With our long-term success in designing embedded modules, carrier boards, and systems, ADLINK, as an NVIDIA® Quadro® Embedded Partner, can quickly develop edge AI platforms based on NVIDIA Quadro Embedded GPUs and Jetson modules, catered to individual project needs. This is what enables our customers to rapidly harness the power of AI at the edge.

FAQs

Q1 Where are the business opportunities for embedded graphics?

A

GPUs are used in embedded applications demanding high-resolution, multi-display capability, parallel computing, and AI enablement. ADLINK sees applications such as clinical diagnostic imaging devices, rugged military laptops and imaging radar for aerospace and defense, and gaming slot machinesas presenting considerable potential to benefit from embedded graphics.

Top-down applications that can benefit from embedded graphics further include

- High-resolution, multi-display setup: Applications include air traffic control, electronic chart displays and information systems (ECDIS), video walls, digital signage, gaming, and healthcare environments
- Parallel computing: High-performance application processing including radar/ sonar systems in aerospace and defense, ultrasound imaging in healthcare, and accelerated multi-access edge computing (AMEC) in telecoms
- AI engines: System training and inferencing in smart manufacturing, smart city, telecom, aerospace and defense, and transportation

Q2 Why should customers choose ADLINK embedded graphics products powered by NVIDIA Quadro Embedded GPUs?

A

- **Longevity support:** Product availability is 18 months for consumer-grade NVIDIA® GeForce® GPUs and 3 years for NVIDIA Quadro GPUs while NVIDIA Quadro Embedded GPUs support 5+ year availability in line with embedded application requirements. ADLINK MXMs support 5-year availability. PEG cards support 3-year availability which can be extended to additional 5 years under an extended life program.

Model	Longevity Support
MXMs	5 years
PEG Cards	3 (+5)* years

* Special conditions apply

- **Lower development costs:** Long lifecycle support translates into reduced development time, effort, and costs associated with graphics entering end-of-life (EOL). Development costs can reach six figures[4] for safety-critical applications that undergo time-consuming verification and testing processes. As consumer-grade graphics could reach EOL three times through the lifecycle of an embedded graphics solution, it is obvious that developing with embedded graphics would yield a superior return on investment (ROI).
- **Increased system responsiveness:** NVIDIA GPUDirect RDMA in NVIDIA Quadro Embedded GPUs can boost data throughput by approximately 80% and lower latency by 60%[5] . A direct path for data exchange is established between the GPU and third-party devices3, eliminating the need to copy data to CPU memory before reaching the GPU, such that data throughput and system responsiveness are significantly increased for GPU-accelerated applications.

Q3 How are NVIDIA Quadro Embedded GPUs benchmarked?

A

For graphics-intensive applications involved with high-resolution, multi-display setup, please refer to performance benchmark testing results in Figure 8. For compute-intensive applications involved with highly-parallel workloads or AI training and inferencing, please refer to performance benchmark testing results in Figure 8 and Figure 10. If you can't find professional software, or AI networks used in your industrial applications, please contact ADLINK for more detailed GPU performance benchmark results.

Q4 Why should customers choose ADLINK embedded graphics products over other graphics products?

A

ADLINK embedded graphics products offer long lifecycle support and very high performance, key requirements for many embedded applications. For high-resolution, multi-display applications, ADLINK embedded graphics products are a good choice when four or less displays are needed. As for highly-parallel computing and AI applications, ADLINK embedded graphics products can reduce CPU overhead, boost data throughput by approximately 80%, lower latency by 60%, and increase system responsiveness.

Q5 Why buy embedded graphics products powered by NVIDIA Quadro Embedded GPUs from ADLINK or ADLINK's distributors?

A

ADLINK is the top choice for embedded customers. Among a few NVIDIA Quadro Embedded Partners in the world, ADLINK is one of the few with market-proven experience offering diverse product portfolios that address embedded application needs. ADLINK's offerings, including embedded graphics in MXM and PEG form factors, and MXM- and PEG-compatible platforms and modules, accelerate and facilitate GPU adoption in embedded applications.

Q6 How do I choose ADLINK embedded graphics products for embedded applications?

A

ADLINK's Mobile Express modules (MXMs), with high performance per watt and extended operating temperature options, are an ideal fit for mobile, SWaP-constrained, passive-cooling applications such as portable ultrasound, airborne radar, and aerial infrared imaging.

PCI Express Graphics (PEG) cards connect via a common interface, making them easy to integrate and use in many embedded applications, such as MRI and CT scanning in healthcare, quality inspection in industrial automation, and telecom multi-access edge computing.

GPU onboard solutions can fulfill ODM project requirements in different verticals (e.g., gaming and medical) and for various form factors, like PC/104 and VPX.

Q7 Other NVIDIA GPU-powered Mobile Express modules are available online. Why should I buy from ADLINK or ADLINK's distributors?

A

ADLINK and our distributors offer MXM modules powered by NVIDIA Quadro Embedded GPUs with five-year availability and technical support that cannot be offered by online vendors. Online NVIDIA GPU-powered MXMs are highly likely to be gray market goods without warranty or long lifecycle support. Additionally, ADLINK provides technical support to allow users to configure Quadro-powered MXMs for consistent or maximum performance, lower I/O latency, and higher responsiveness, better fulfilling application requirements.

Q8 What are lifecycles of NVIDIA Jetson Platforms?

A

Some Jetson platforms are available through 2026. The long lifecycle support is in line with embedded application requirements.

Introduction

ADLINK's newly introduced MVP-6010/6020 Series value line of fanless embedded computing platforms, incorporating the 6th Generation Intel® Core™ processor, provides one PCIex16 and three PCI or two PCIe x8 and two PCI expansion slots, 1 mini PCIe slot and single-side access for I/O ports, optimizing easy maintenance in industrial automation environments. The series retains the robust design of all ADLINK MXC/MXE lines, at a new extremely cost-effective price point.

The MVP-6010/6020 Series supports dual-channel DDR4 memory for more powerful computing and the Intel® HD Graphics 530 speeds graphics performance. Along with a versatile I/O array and flexible expansion capacity, the MVP-6010/6020 Series fully satisfies all the needs of industrial automation with the performance demanded by vision inspection, motion control, and surveillance applications. Fanless construction not only overcomes contaminant and noise challenges presented by harsh IA environments, the elimination of problematic structural elements that negatively affect MTBF greatly increases life cycle expectations for the platform.
